

Problem: Apply a linear sequence of operations to some data

Solution: Overwrite the original?

```
foo_foo <- little_bunny()
```

```
foo_foo <- hop(foo_foo, through = forest)
foo_foo <- scoop(foo_foo, up = field_mice)
foo_foo <- bop(foo_foo, on = head)
```

Downsides:

1. Debugging is painful; if you mess up you have to re-run from the beginning
2. Repetition obscures what's changing on each line

Problem: Apply a linear sequence of operations to some data

Solution: Function composition?

```
foo_foo <- little_bunny()  
bop(  
  scoop(  
    hop(foo_foo, through = forest),  
    up = field_mice  
  ),  
  on = head  
)
```

Downsides:

Difficult to understand the flow of the program. You have to read this code inside out instead of top to bottom
