Pipes in R

Problem: Apply a linear sequence of operations to some data

Solution: Save intermediate results to new variables?

```
foo_foo <- little_bunny()

foo_foo_1 <- hop(foo_foo, through = forest)
foo_foo_2 <- scoop(foo_foo_1, up = field_mice)
foo_foo_3 <- bop(foo_foo_2, on = head)
```

Downsides:

1. The code is cluttered with unimportant names

2. You have to carefully increment the suffix on each line.
